

Valueflows

A vocabulary for economic networks

<https://valueflo.ws>

Valueflows is a standard vocabulary

- Valueflows is a vocabulary to describe **flows of economic resources** of all kinds within distributed economic ecosystems
- Its purpose is to **enable inter-networking** among many different software applications, used by many different kinds of economic formations
- Examples are value networks, supply chains, joint ventures, business collaboration networks.... as well as individual organizations
- Valueflows supports
 - **Exchange/transfer** (mutual credit, marketplace, e-commerce, offer/request matching, gift economy, contribution economy, mutual aid, etc.)
 - **Production/creation** (manufacturing, supply chain, distribution, digital and knowledge works, services, etc.)

Valueflows is based on REA

REA stands for **Resources**, **Events**, **Agents**.

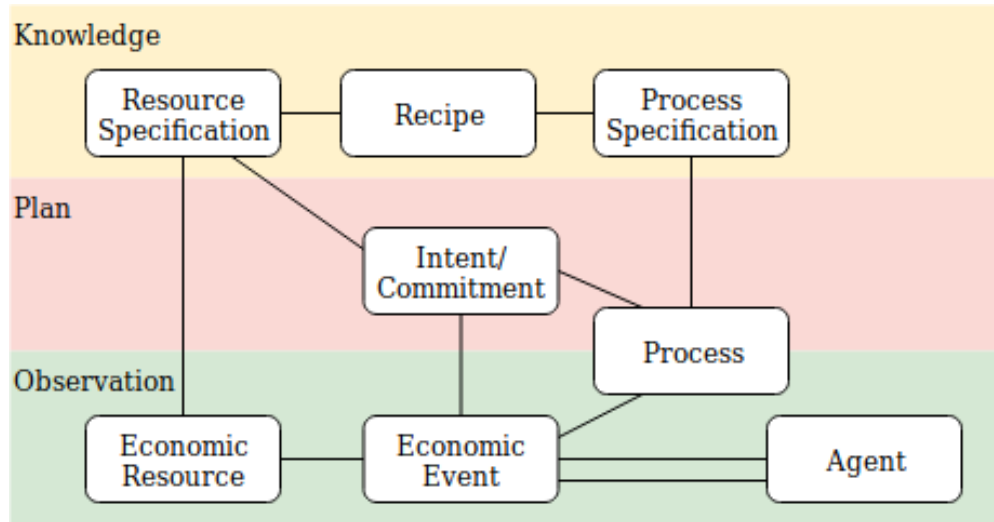

Agents are individual persons or organizations or ecological agents, who perform Economic Events affecting Economic Resources.

An Economic **Event** can take actions like produce, modify, consume, or use Economic Resources, or transfer them from one Agent to another.

Economic **Resources** could be

- Useful goods and services
- Knowledge, designs
- Money, alternate currencies, tokens, credits
- Types of work, skills
- CO₂, methane, heat
- Air, water, soil microbiota
- ...

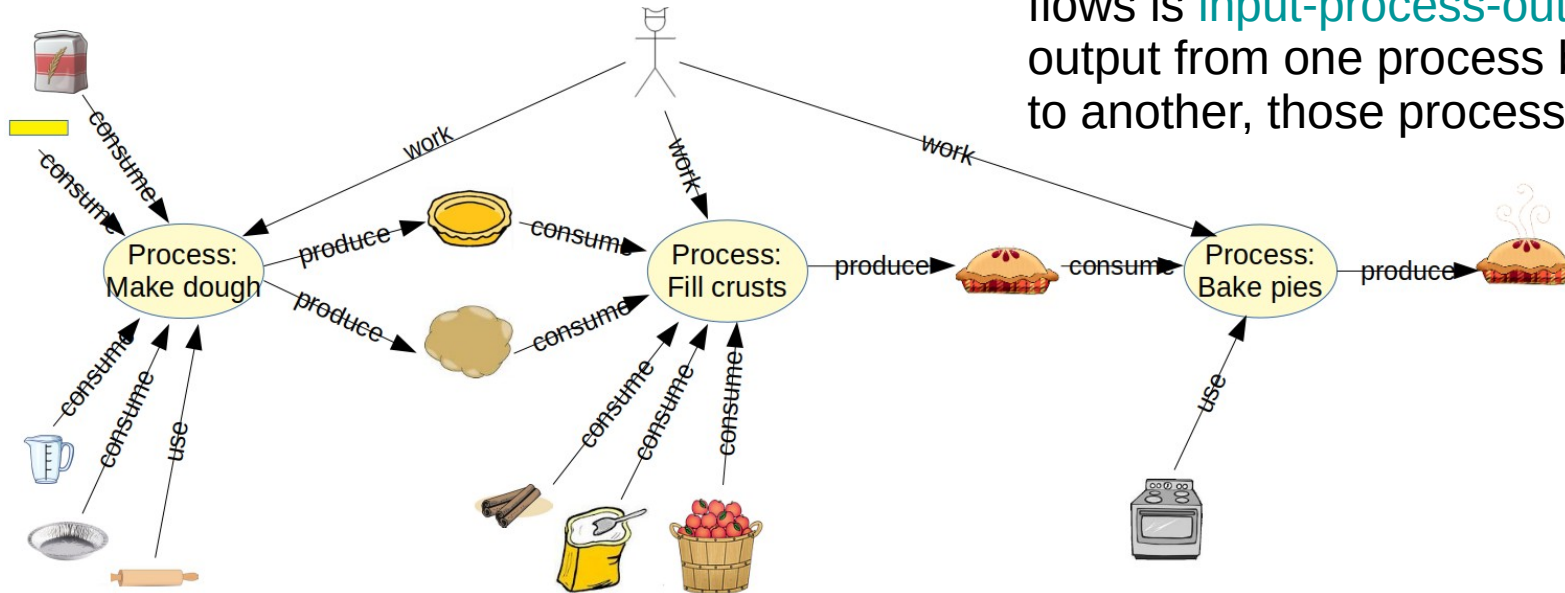

Levels of the Valueflows ontology

- The **Knowledge** level represents classification, policies, procedures, rules and patterns. This is where each network or community can configure the core concepts to fit their needs.
- The **Plan** level represents offers and requests, schedules and promises. This level can also support budgeting or other pre-operational general planning.
- The **Observation** level represents what really happened. This is used for coordinating operations, accounting, other reporting and analysis.

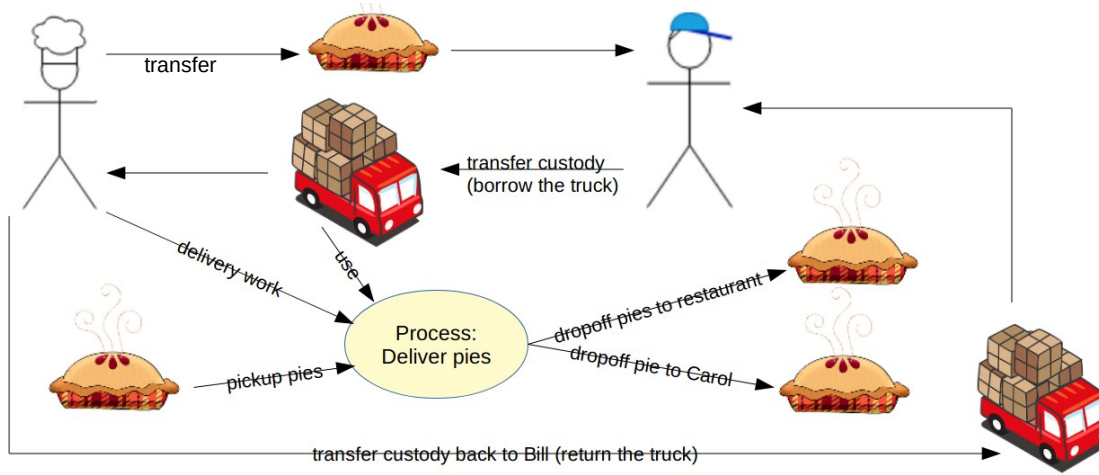

Flows: input-process-output

The first basic pattern for modeling resource flows is **input-process-output**. When an output from one process becomes an input to another, those processes are connected.

Processes can be defined at whatever level makes sense. For example, having 3 processes in this flow allows operational flexibility: The baker can make a lot of dough and use it for blueberry and pumpkin pie, as well as apple pie. Then she might want to bake different kinds of pies in one oven at the same time too, or freeze half of the unbaked apple pies to bake later.

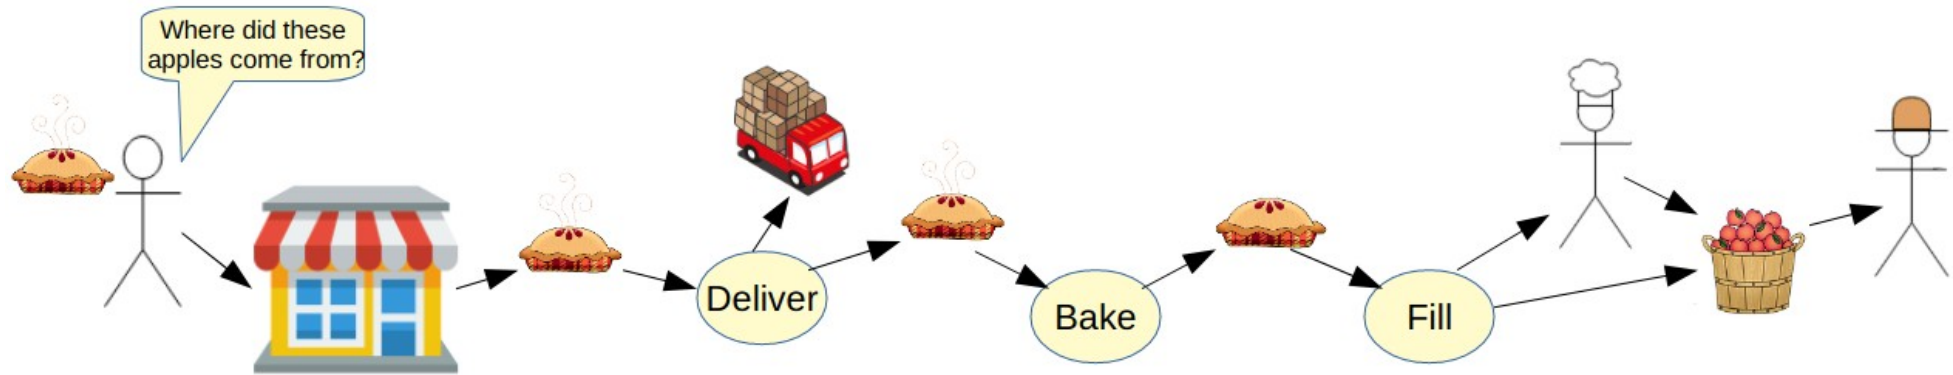

Flows: exchange and distribution

The second basic pattern for modeling resource flows is **transfer**, where a resource goes from one agent to another, without being changed. If there is another transfer reciprocal to the first, they are an **exchange** of resources.

Transfer of resources, transformation and transportation of resources, can all connect into larger resource flows. Resource flows can be of any length, and can be circular.

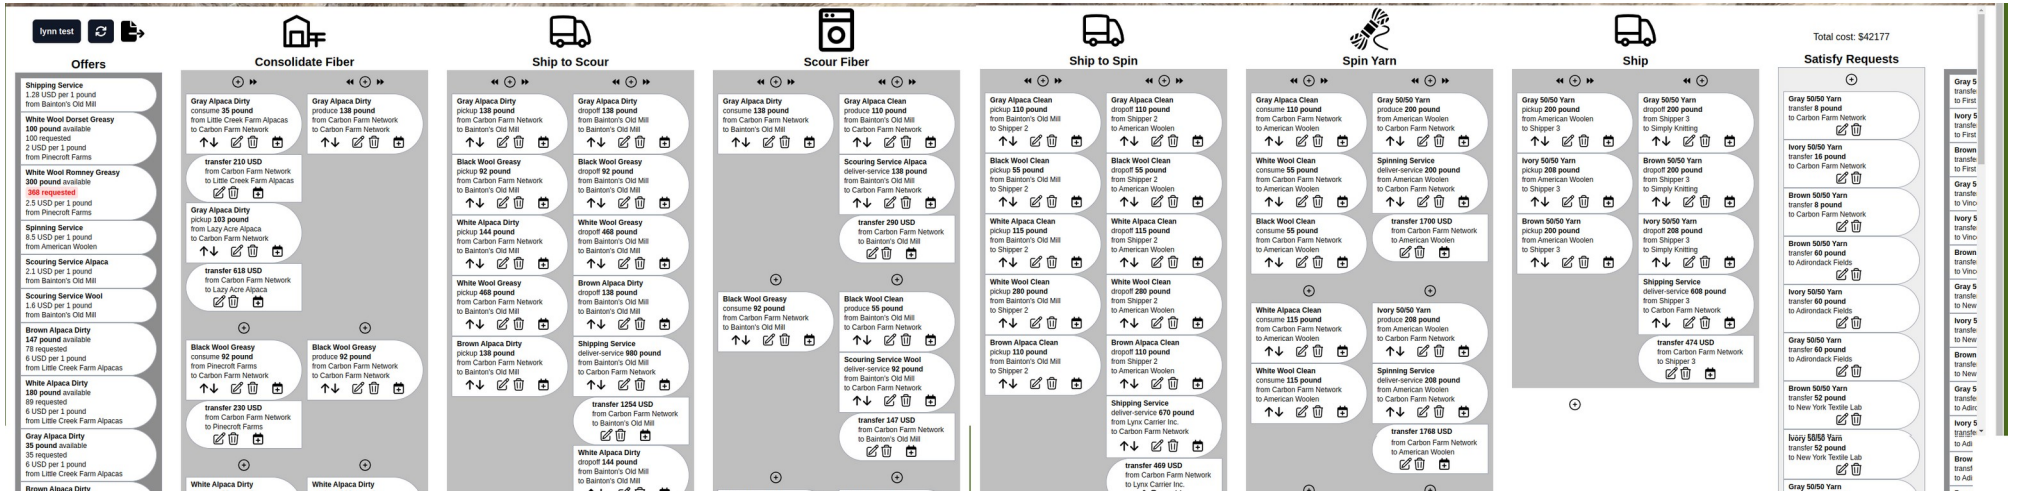

Flows: tracking and tracing

One of the most often used traces is to find the origin(s) of health problems like mad cow disease, and tainted drugs and food; then the flows are tracked forward to find all possible effects from the original problem.

A nicer story: A restaurant customer might find out that the pies are made by a local baker who uses all organic ingredients. They might find out that the apples come from a cooperative worker-owned apple orchard.

A demo of a textile supply chain

This textile supply chain includes sheep and alpaca farmers, scouring mills, spinning mills, shippers, and textile designers. Each of these is a **node in the network** who needs to coordinate with other nodes. In this case, the cooperative of designers coordinates the whole supply chain.

A farming app for short supply chains

“GrowGood empowers farmers to track their operations from seed to sale, creating a verifiable, auditable record of their entire production process. We are building the digital backbone for a more transparent and regenerative food system.”

GrowGood will support farm operations configurable from starting blueprints by type of farm; also sensor input, and climate and ecosystem accounting.

The arrows below are resource flows (intents, commitments, economic events) using Valueflows and JSON-LD. The software used by suppliers, marketplaces, etc. does not have to be Valueflows internally. Although one standard is best, if the api can't be Valueflows JSON-LD, a translation layer can be written.

The diagram illustrates the supply chain for various wool products, organized into three main stages: Raw Wool, Spinning Service, and Finished Products. Each stage includes specific product details, weights, sources, and icons representing different wool types.

- Raw Wool Stage:**
 - Gray Alpaca Clean:** consume 150 pound from Carbon Farm Network to American Woolen. (Icons: Alpaca, Wool, Spinning, Bag)
 - White Wool Clean:** consume 150 pound from Carbon Farm Network to American Woolen. (Icons: Wool, Spinning, Bag)
 - Black Wool Clean:** consume 85 pound from Carbon Farm Network to American Woolen. (Icons: Wool, Spinning, Bag)
- Spinning Service Stage:**
 - Gray 5050 Yarn:** produce 200 pound from American Woolen to Carbon Farm Network. (Icons: Alpaca, Wool, Spinning, Bag)
 - Spinning Service:** deliver service 200 pound from American Woolen to Carbon Farm Network. (Icons: Wool, Spinning, Bag)
- Finished Products Stage:**
 - White Alpaca Clean:** consume 115 pound from Carbon Farm Network to American Woolen. (Icons: Alpaca, Wool, Spinning, Bag)
 - White Wool Clean:** consume 115 pound from Carbon Farm Network to American Woolen. (Icons: Wool, Spinning, Bag)
 - Brown Alpaca Clean:** consume 110 pound from Carbon Farm Network to American Woolen. (Icons: Alpaca, Wool, Spinning, Bag)

Arrows indicate the flow of materials and services between these stages, showing the integration of alpaca and wool products in the supply chain.

to Shipper 3  
474 USD"]
  
```

The flowchart illustrates a sequence of transactions. It begins with a 'Gray 5050 Yarn pickup 200 pound from American Woolen to Shipper 3' for 200 USD. This is followed by 'Ivory 5050 Yarn pickup 208 pound from American Woolen to Shipper 3' for 208 USD, then 'Brown 5050 Yarn pickup 208 pound from American Woolen to Shipper 3' for 208 USD. The next step is 'Ivory 5050 Yarn pickup 208 pound from Shipper 3 to Simply Knitting' for 208 USD. This leads to 'Shipping Service deliver service 608 pound from Shipper 3 to Carbon Farm Network' for 608 USD. Finally, there is a 'transfer 474 USD from Carbon Farm Network to Shipper 3' for 474 USD. Each transaction box includes a title, the amount, and three icons: a double-headed arrow, a trash can, and a lock.

Total cost: \$42177
